

Workshop Lesson 1

Description

The way that the competitions work is that the computer "tests" the output of your code and the test is passed only if it matches EXACTLY!

To try it out, write a program using the "print" statement to output EXACTLY the string "Hello, World!".

Your code should look like this:

```
print("Hello, World!")
```

Now save the .py file as ws1.py and "Submit" your code to this problem on DomJudge.

Make sure you choose "Python3" as your language and choose the correct file and problem.

Wait a few seconds and refresh the page to see if you passed!!

We will be doing that for every one of the following questions and for the programming competition puzzles.
